

Easy. Simple. Accurate.

1 Just have your dog chew on the salivary rope provided to you! Your pet should fast overnight.

2 Send the saliva sample using the return label provided. Results will be sent back to you.

No blood draws. No intradermal, skin patch- Ugly!

Salivary Diagnostics for Food Intolerance

NutriScan is a novel patented diagnostic test based on saliva, which can reveal the latent or pre-clinical form of food sensitivity or food intolerance. Test panels are for the most common allergens including:

Panel 1

beef
corn
wheat
soy
milk (cow)
lamb
venison
chicken
turkey
white fish
pork
duck

Panel 2

egg (hen)
barley
millet
oatmeal
salmon
rabbit
rice
quinoa
potato
peanut* (peanut butter)
lentil
sweet potato

Does your dog or cat:

- have itchy skin?
- have stomach discomfort?
- belch or have gas?

Foods Tested

The Nutriscan® Advantage

	NUTRISCAN	OTHER FOOD SENSITIVITY TESTS
What is the test?	Intolerance + Sensitivity	Hypersensitivity (Allergy)
Medium tested	Saliva	Serum
Antibody measured	IgA and IgM	IgE or IgG
How performed	Home use or Vet visit	Veterinary visit required
Addressing the real food issues	Delayed and long term clinical correlation	Immediate food issues only, poor clinical correlation to more delayed food reactions
Which foods	24 antigens (2 panels of 12 each: a primary and a secondary panel)	About 20 antigens

Does your dog or cat:

- have itchy skin?
- have stomach discomfort?
- belch or have gas?

Do you suspect your dog or cat has a food intolerance?

Food intolerance or sensitivity is actually quite common whereas food allergy is rare. In fact, food intolerance is the third most common sensitivity condition in cats and dogs and often can be easily remedied with a change in diet. For years, though, the difficulty lay in figuring out what foods were problematic – until now.

Developed by world renowned veterinarian, Dr. Jean Dodds, NutriScan tests for the twenty four most commonly ingested foods by dogs and cats to provide you with specific results as to your dog's or cat's food intolerances or sensitivities. Since it is a salivary test, you have the convenience to complete the test at home or at your veterinarian's office. Best of all, you can have the results in approximately ten days to help you put your companion animal on the right diet.

Developed by a Veterinarian.

Tested by a Veterinarian.

Safe and more accurate than other food sensitivity tests for dogs and cats.
